

Prompt Engineering Problem Set #2

You are required to use Meta Llama 3 8B model for the exercise below. Load the model as a server and issue the prompts from the client.

- (a) Following is the list of: Parliamentary constituency, assembly segments, party names and votes polled by them in a parliamentary constituency (that has several assembly segments). The table has 28101 tokens on Llama 3 tokenizer. You are required to capture the data such that the representation has minimum tokens possibly fitting within 8k. You are allowed to remove independents (IND). Hint: You are allowed to transform the input table in to a more compact form only using prompt engineering. Your deliverable is: Final count of tokens and your prompt that achieves this result.
- (b) Using the transformed data, perform the downstream task of determining the winner of each constituency, get the runner up, margin and percentage votes polled.
